

Functional Scope

Project Overview

NanaBurguer is a multi-role restaurant operations SaaS platform designed to centralize restaurant workflows including dine-in orders, delivery management, pickup orders, payments, reports, and operational administration.

The system follows a modular monolith architecture using Clean Architecture principles and is designed for future SaaS scalability.

Current MVP Scope

The MVP includes:

- User authentication and authorization
 - Role-based access control
 - User management
 - Menu and category management
 - Dine-in order management
 - Delivery order management
 - Pickup order management
 - Kitchen ticket generation
 - Payment processing
 - POS receipt generation
 - Daily cash register closing
 - Operational reports
 - Shared database tenant strategy
-

User Roles

Admin

Full system access.

Responsibilities:

- Manage users
- Assign roles
- Manage menu
- Manage categories
- View reports

- Authorize item cancellations
 - Configure restaurant operations
-

Cashier

Responsible for sales and payment operations.

Responsibilities:

- Create orders
 - Register payments
 - Close orders
 - Generate receipts
 - Perform daily cash closing
-

Waiter

Responsible for dine-in customer operations.

Responsibilities:

- Create table orders
 - Send orders to kitchen
 - Move orders between tables
-

Delivery

Responsible for delivery and pickup operations.

Responsibilities:

- Register delivery orders
 - Register pickup orders
 - Update delivery order states
-

Kitchen

Receives kitchen tickets for food preparation.

Responsibilities:

- Receive kitchen orders
 - Print kitchen tickets
-

Order Types

The platform supports:

- DINE_IN
 - DELIVERY
 - PICKUP
-

Payment Methods

The platform supports:

- Cash
 - Card
 - Transfer
-

Reports Included

- Daily sales reports
 - Monthly sales reports
 - Delivery reports
 - Pickup reports
 - Payment method reports
 - Best selling products
 - Orders by status
 - Daily cash closing reports
-

Current Technical Limitations

The current MVP does not include:

- Inventory management
 - Multi-branch management
 - Real electronic billing
 - Customer mobile applications
 - Online payments
 - Advanced kitchen workflow
 - Real-time notifications
-

Planned Future Features

Planned future integrations include:

- DIAN electronic billing

- WhatsApp notifications
 - MercadoPago integration
 - Push notifications
 - Cloud storage integration
 - Multi-branch support
 - Subdomain-based tenant isolation
-

Architecture Summary

The system is implemented as a modular monolith using Clean Architecture principles.

Current architecture includes:

- Shared database strategy
 - JWT authentication
 - RBAC authorization
 - Prisma ORM
 - REST API architecture
 - AWS deployment readiness
-

Deployment Environment

The platform is designed for AWS deployment and future SaaS scalability.
